

Advanced Mobile

➔ Benefit from customizable mobile functionality that works with your existing Infor EAM applications, accessed on a single, handheld device.

Be enterprising.

Today, as much work is done outside the office as inside. Competitive companies recognize that they must be able to move business information quickly from the desktop to the field and back. They need a true “mobilized” version of their existing asset performance management application—one that not only enables data capture from multiple sources, but also provides functionality that supports better decision-making in the field. Enterprising companies demand a solution that not only enables technicians to log their hours, but also allows them to access tools and information so they can complete their jobs efficiently and accurately.

Leverage experience.

Infor™, a developer of superior enterprise asset management (EAM) solutions, and Blue Dot Solutions, a leading provider of intuitive mobile and wireless computing solutions for asset-intensive companies, have partnered to respond to this need for adaptable mobile functionality that supports multiple applications on a single handheld device. The solution: Infor EAM Advanced Mobile.

Advanced Mobile enables businesses to benefit from unique mobile functionality that addresses business-specific processes and needs, without costly customization. Companies can tailor their mobile applications through this solution’s flexible, powerful, and easy-to-use mobile framework. In addition to realizing a quick return on investment, organizations that implement Advanced Mobile gain a state-of-the-art mobile computing infrastructure that is positioned for growth well into the future.

Get business specific.

Advanced Mobile's adaptable framework is used in conjunction with—and extends the value of—existing EAM solutions, including Infor EAM Enterprise Edition, Infor EAM Business Edition, and Infor EAM MP2, as well as related mobile offerings including Infor EAM Pocket MP2 Plus and Barcoding Plus.

Advanced Mobile provides initial mobile operating parameters and specifications for users, as well as a customizable framework that allows organizations to meet their specific mobile operating needs. This solution leverages the Infor Open Service-Oriented Architecture (SOA), which enhances solution interoperability as well provides protection from obsolescent interfaces. The result: a broad-based, flexible, expandable mobile solution.

The solution's infrastructure supports functionality such as:

- GIS/GPS
- RFID processing
- Touch-screen operations
- Multidimensional barcode reading
- Custom screens/workflows
- Integration with advanced calibration
- Simultaneous integration to multiple back-end systems (ERP, HR, etc)

Why A Mobile Framework?

Blue Dot's mNOW! Mobile Framework is the underpinning technology of the Advanced Mobile infrastructure. This multi-channel access gateway (MAG) acts as a traffic manager and provides the foundation for:

- Uploading and downloading information faster data to and from handheld devices through advanced queuing and synchronization.
- Precisely customizing handheld operations to fit specific business processes.
- Integrating multiple mobile operations to receive and distribute incoming and outgoing data with multiple back-end systems.
- Adapting as new needs arise and new developments emerge.

Advanced Mobile Kit

Advanced Mobile includes the Command Center, the central management and administration console; the Application Design Tool, a design and configuration environment used to create, modify, and "grow" mobile applications throughout the enterprise; and Advanced Mobile GO, which supports multiple mobile devices from traditional handheld products to large tablet PCs.

The solution offers pre-formatted templates, which were developed based on customer experience and represent best practices. Each template contains one or more mobile device operating screens to support specifically grouped functions. Templates include Work Management, Asset Management, Inventory Management, RFID for Preventative Maintenance, Direct Store Delivery, and Inspections & Audits. Each template provides a starting point for establishing customer-unique mobile solutions, and includes support for web services.

See results now.

Before Advanced Mobile, businesses resorted to costly customizations to achieve business-specific mobile functionality. Today, Infor and Blue Dot Solutions companies empower mobile users, achieve quick ROI, and continue to reap the desired business benefits from an advanced, adaptable mobile computing solution.
